ABSTRACT

The Project Farmer's E Market deals with the automation of traditional market system. It includes both sales and purchase of items. The project Farmer's E Market is developed with the objective of making the system reliable, easier, fast, and more informative. There is a lot of reason for the introduction of this project. In the manual System, there are number of inefficiencies that a salesperson(farmer) faces. Large records-books have to be maintained where relevant and irrelevant information has to be stored which is very untidy and clumsy process. But our System reduces paper works. On the other hand, there are many inherent problems that exist in any manual system. Usually, they lack efficiency. Less efficiency has a great impact on the productivity of any human being keeping the data up-to-date. The different modules included in our project are administrative module, purchase module, sales module and billing module. Farmers can signup to get unique username and password. Each farmer can login with the help of his/her unique id and password. They can add their farm products from there. Similarly public user can signup on the system. With their unique username and password they can view and buy products from farmers which are near to them on the basis of pincode. Purchase and Sales module contains all the purchase and sales details. All the payment details will be shown in the order history module.
